

## EP1 A5 Size Machine

---

The EP1 is ideal for producing personalized phone covers, MP3 player covers and similar items. The A5 film normally provides one part per print, simplifying the management of individual orders. The EP1 uses the latest heating technology and control algorithms to provide consistent part quality even on delicate thin-walled items.

The transfer cycle of the EP1 is fully automatic, with a colour touchscreen providing operator feedback.

The EP1 has a standardized keyslot mounting system for jigs, with jigs being available to fit many of the most popular smartphone covers on the market.

For customers wishing to decorate other items, we also offer a custom-made jig service, using the latest CAD/CAM technology for form and vacuum flow.

The EP1 has five pre-set programmes included. These have been developed over a long period of testing and proved to be suitable for most applications.

EP1E extended memory is available as an option, and this offers the user the five preset programmes plus a further 95 programmes that can be user edited as required.
